Uzbekistan Airways training center new project

2023 27 April

The training center of Uzbekistan Airways is developing its project for the initial training of pilots. Currently, 15 graduates of technical universities are studying at the courses, who are mastering the profession of a pilot. At the same time, the rapid development of air transportation requires an increase in the number of course participants up to 50 people per year.

In order to expand the training base in our Center, a new single-engine aircraft simulator FNPT Cessna 172 was granted for operation. This simulator was manufactured in the company TRC simulators, by Netherlands and complies with the requirements of ICAO standards for pilot training. By the end of this year, Uzbekistan Airways plans to put into operation another simulator for the initial training of future aviators, and is also negotiating the purchase of its own Cessna training aircraft.
