Uzbekistan Airways returns Boeing 767 to the sky after deep modernization

2025 7 May

On the eve of the summer season, the fleet of Uzbekistan Airways is being replenished with a renewed wide-body Boeing 767 aircraft with registration number UK67007. The aircraft, after long storage, has undergone extensive technical preparation and will soon begin operating flights. The return of this aircraft to service was part of a program to meet the growing demand for flights, increase the frequency of flights, and open new destinations. We are closely monitoring the growth rate of transportation and actively developing our fleet.

"Uzbekistan Airways Technics" LLC specialists have completed a large-scale work, transforming the "preserved" aircraft into a full-fledged, technically upgraded airliner.

The chassis has been completely replaced, new engines and auxiliary power units (VSU) have been installed, and all necessary procedures for the severe forms of C-checks have been performed. Special attention was paid to the passenger cabin: the interior was updated taking into account the requirements of comfort and includes refinements that go beyond standard regulatory service. The layout of the board includes 18 business class and 246 economy class seats.
